Latest Version: 6.1

Question: 1

A customer has been told the platform arrives pre-integrated, and concludes that their team will have nothing to do once it is delivered.
What should the integrator correct?

A. Preparation tasks remain before any team can begin work
B. The platform will require a rebuild before it can be used
C. The components must still be assembled by the customer
D. The team must first choose between the available components

Answer: A

Explanation:
Pre-integration removes the work of making the components function together, which is substantial. Certificates, projects and data connections still have to be established before a team has anything usable.

Question: 2

Why are servers managed in groups rather than individually?

A. Individual servers cannot be onboarded to the service on their own
B. A baseline is defined once and applied consistently across them
C. Grouping reduces the number of controllers and consoles needed
D. Grouping is required before a server can report its health

Answer: B

Explanation:
Defining configuration and update state at the group level is what keeps a fleet identical over time. Managing servers one at a time is exactly how the configuration drift that the tooling exists to prevent gets in.

Question: 3

A customer worries that adopting cloud-based management means their workloads will run outside their own data center.
Why is this concern misplaced?

A. The service operates entirely inside the customer's network

B. Only the management plane is hosted; the servers stay on site
C. The workloads move; the data stays in the customer's own control
D. Workloads run in the cloud only during maintenance windows

Answer: B

Explanation:
What moves to the cloud is the console, the configuration definitions and the telemetry about the estate. The servers, the workloads and the data remain exactly where the customer installed them.

Question: 4

An integrator is describing the benefits of the NVIDIA software supplied with the platform.
Which two apply?
(Select two.)

A. Inference optimized for the accelerated hardware beneath
B. Packaging that deploys a model without building a runtime
C. Support entitlement for the customer's own applications
D. Models trained automatically from the customer's data
E. Storage capacity added to the platform as it is needed

Answer: A,B

Explanation:
The software is tuned for the accelerators it runs on, so the same hardware serves more requests than a generic stack would. That efficiency is a direct return on the platform investment.
A model arriving with its serving runtime already assembled removes a build step teams would otherwise repeat for every model. It is the difference between deploying and engineering.

Question: 5

An integrator is preparing to install VM Essentials at a customer site.
Which two must be in place first?
(Select two.)

A. A support case opened with the software vendor beforehand
B. Physical hosts that meet the hypervisor's requirements
C. A completed inventory of the customer's applications
D. Network connectivity between the hosts and the manager
E. Virtual machines defined ready for the first cluster

Answer: B,D

Explanation:

The hypervisor runs directly on the hardware, so hardware that cannot support it stops everything. Confirming this is the first readiness check.
The manager administers hosts across the network, so a host it cannot reach cannot be adopted. Connectivity underpins every later step.
