Latest Version: 6.0

Question: 1

Castleford Energy Settlement needs hourly zonal load from its independent system operator for 40 load zones. Each zone has a standalone data request measuring component, and every request goes to the same system operator once a day on the same schedule. The team wants the least configuration per component.
Which approach best meets this requirement?

A. Set the timetable on the operator's service provider record and schedule the Create Scheduled Settlement Transaction batch
B. Add the 40 components to an aggregation group scheduled by a processing timetable
C. Set the Processing Timetable Type and Service Provider on the measuring component type, leaving both blank on each component
D. Use Request Data on each component every morning, entering the operating day as start and end

Answer: C

Question: 2

Wyndham Networks, a distribution network operator, uploads a CSV file of interval load data for a standalone measuring component; the file contains two gaps of several hours. A second CSV file holds monthly scalar readings for another standalone measuring component.
Which two statements describe how these uploads are processed?
(Choose two.)

A. The interval file loads as one initial measurement, with the gaps left as missing intervals
B. A new initial measurement starts at each gap in the interval file longer than one interval
C. Each row of the scalar file is loaded as its own initial measurement
D. Rows of the scalar file are appended to the latest existing initial measurement
E. Uploaded values bypass VEE and are written straight to the final measurement table

Answer: B,C

Question: 3

At Brightwater Electric, a retail electricity supplier, an administrator adds a new criterion to a measuring component set so that net-metered service points are excluded from supplier aggregation. The data source still uses the base template SQL, with no custom lookup value.
Which part of the data source template SQL does the new criterion extend?

A. The Find Constituents SQL, which is extended by the attributes held on the aggregator components
B. The Aggregation SQL, extended by the UOM, TOU and SQI value identifiers on the component type
C. A custom Data Source SQL lookup value, which must exist before any criterion can take effect
D. The Dimension Scanner SQL, which is extended by the set's criteria, dimensions and individually managed items

Answer: D

Question: 4

In the Harrowgate retail electricity market, one entity must submit to the regional grid operator, each afternoon, the expected hourly usage of every supplier's customers for the next day. It derives those figures mostly from load-profiling results rather than from interval meter reads.
Which market participant role performs this function?

A. Independent System Operator (ISO)
B. Energy Service Provider (ESP)
C. Schedule Coordinator (SC)
D. Distributor (DisCo)

Answer: C

Question: 5

The operator of the Talmore wholesale balancing market requires that a buyer hold at most one valid contract of a given contract category at any point in time. Lindqvist Settlements is configuring market contracts and wants the system to enforce this requirement.
What should the team configure?

A. Unique Contract Buyers set to Yes on each buyer's market participant record
B. Unique Contract Buyers set to Yes on the market contract type used for that contract category
C. One contract code shared by every contract of that category, so a second is rejected
D. A separate market product set per buyer, holding that buyer's contracts

Answer: B

Question: 6

Blackwater Energy Networks is the provider of last resort for both electricity and gas in one retail market. Its electricity POLR products and awards are already grouped in a market product set. The analyst now has to add gas POLR supply products whose awards will be allocated from gas POLR load.

How should the gas products be placed in the market product hierarchy?

A. Add them to the electricity product set with a later execution sequence than the electricity products
B. Create a gas market contract type and link the gas awards directly to it
C. Add them as award details on the existing electricity products
D. Create a separate market product set for the gas service type in the same market

Answer: D

Question: 7

Northgate Energy Retail's settlement subscription for its residential portfolio had its only calculation group end-dated on 31 March when a tariff redesign was postponed. No replacement group has been added to the subscription. The settlement subscription type lists three valid calculation groups and names one of them as its fallback.
How is a settlement transaction for an April calculation period calculated?

A. It runs the fallback group named on the subscription type, because no group is in effect on the subscription
B. It runs all three valid calculation groups listed on the subscription type in their configured sequence
C. It keeps running the end-dated group until a replacement group is added to the subscription
D. It stops with a Terminate exception, since a subscription must reference a group that is in effect

Answer: A

Question: 8

A small market price publisher supplies day-ahead prices to Redfern Utilities. The publisher has no interface for sending data and cannot respond to requests; it only posts a spreadsheet each day that staff save as a CSV file.
How should Redfern Utilities bring the prices into the system?

A. Configure a standalone data request measuring component that requests the prices from the publisher every day
B. Register the publisher as an external system sending each CSV file as a regular feed to the measurement import
C. Upload each file with Load IMDs (CSV) on the measuring component
D. Load the spreadsheet as an aggregation data source whose template SQL reads the prices

Answer: C

Question: 9

Fenwick Power, a distribution network operator, runs interval proxy day estimation for a newly connected service point. Its measuring component comparison type compares the measuring component with its own history, using the same date last year. The meter was installed three weeks ago, and estimation finds no usable comparison days.
Which change to the comparison type is most likely to produce usable comparisons?

A. Increase the maximum number of comparison results it stores
B. Compare against a factor profile rather than the measuring component's own history
C. Relax the Average Difference Eligibility so more days can qualify
D. Extend the days before and after the same date last year

Answer: B

Question: 10

Lindqvist Power, a distribution company, applies an annual loss percentage to secondary-voltage load. For transmission-connected load it must instead apply hourly dynamic loss factors derived from system conditions. Both populations are aggregated by the same aggregation group today.
Which configuration lets each population receive its own loss calculation?

A. Loss class as an aggregation dimension
B. One static loss factor that averages both voltage populations
C. The Settlement aggregation category for transmission load
D. A separate processing timetable type for each voltage population

Answer: A
