## Question: 1

What is the primary purpose of the CA API Gateway Virtual Appliance Architecture?

Response:

- A. Managing SSL certificates for secure communication
- B. Ensuring scalability and performance of API operations
- C. Handling logical configurations for API policies
- D. Physically installing the Gateway on existing infrastructure

**Answer: D**

## Question: 2

Which tool is commonly used for analyzing and troubleshooting mobile app requests in CA Mobile API Gateway?

Response:

- A. Policy Manager
- B. OAuth Toolkit
- C. Gateway Analytics
- D. Network Zones Manager

**Answer: C**

## Question: 3

When you build a RESTful policy, you can use an assertion that can take a single-valued input and convert it to a multi-valued context variable that can be accessed later in the policy.

Which assertion enables you to do this?

Response:

- A. Join Variable
- B. Split Variable
- C. Look up Context Variable
- D. Manipulate Multivalued Variable

**Answer: B**

## Question: 4

Which statements about Gateway clusters and replication are TRUE?

(Choose two)

Response:

- A. Peered MySQL database units become master and slave to each other, an arrangement that is also known as master-master replication.
- B. No more than two MySQL database servers may be configured for replication in a Gateway cluster regardless of the number of Gateway processing nodes.
- C. The maximum number of MySQL database servers you can configure for replication in a Gateway cluster is an even "peered" number proportional to the number of Gateway processing nodes in that cluster.
- D. The load balancer in Gateway clusters provides failover detection by assessing whether a processing node on the network is "alive." Setting the detection frequency to 3 to 5 seconds can provide rapid failure detection that most Gateway clusters can handle.

**Answer: A,B**

## Question: 5

Which features should be configured when setting up service policies for mobile applications in CA Mobile API Gateway?

(Select three)

Response:

- A. API rate-limiting to prevent service overload
- B. JSON transformation for consistent API responses
- C. SSL/TLS encryption for secure API communication
- D. API request and response logging for auditing

**Answer: A,C,D**

## Question: 6

When would you choose to route via HTTP(S) in API Gateway configuration?

Response:

- A. To enhance SSL encryption
- B. When integrating with external HTTP services
- C. Simplify firewall configuration
- D. Optimize load balancing

**Answer: B**

## Question: 7

How does the Mobile SDK handle authorization in CA Mobile API Gateway?

Response:

- A. By validating token expiration times
- B. By granting access based on API versioning
- C. By storing authorization logs locally
- D. By caching API responses for quicker delivery

**Answer: A**

## Question: 8

When is it appropriate to bypass auditing in API Gateway?

Response:

- A. During regular administrative tasks
- B. When the database is full
- C. When optimizing load balancing
- D. For routine SSL certificate deployment

**Answer: B**

## Question: 9

Before you install the CA Mobile API Gateway (MAG), it is important to understand the network zones you will use. Your implementation will use an Internal zone and a DMZ zone.

The zones appear in the Policy Manager. The DMZ zone contains external-facing endpoints and handles user requests coming from the SDK.

What is this zone responsible for?

(Choose three)

Response:

- A. MAG Manager
- B. OAuth test clients
- C. Mobile Single Sign-On (Mobile SSO) protocols
- D. Touchless login using quick response (QR) codes

**Answer: A,C,D**

## **Question: 10**

What is the significance of auto-provisioning in the context of CA API Gateway?

Response:

- A. Automate the installation process
- B. Ensure high availability
- C. Manage database replication
- D. Enhance SSL certificate security

**Answer: A**
